The TubeBaby VST plugin was developed to be a digital simulation of a tube guitar amplifier. As such it features the standard controls found on a real amplifier, namely gain, bass, mid, treble, presence, master and a switch for activating the high gain mode of the preamp stage. The latest version also features a menu that lets you choose between three amplifier types, five cabinet emulations and the amount of high frequency passing through the power amp section. It doesn't sound like a tube, it isn't loaded, it doesn't even have any volume. The sounds it is capable of producing are a result of the careful use of fixed combinations of the 16 standard amplifiers. The TubeBaby can make any amplifier sound great. Any sound in the world can be emulated with the TubeBaby. The TubeBaby's characteristics are basically the ability to emulate at source every well known type of amplifier, but it also have the peculiar ability to create completely new sounds. Every performer has his or her favourite and favourite amplifiers, and the TubeBaby is able to emulate the sound of the most iconic amplifiers of all time. But also new designers, or lesser known brands are taken into consideration, and a wide variety of amplifiers can be emulated in an almost infinite number of combinations. In the following example we will create a signal that originates from two amps with different characteristics, one of them being full hard rock, the other one punk. Both amps are scaled to 40 dB and the settings used for the hard rock amp are as follows: The resulting signal is a guitar sound that is full and hard. Now it's time to process this signal through a tube amp. The settings used for this amp are: The resulting signal is a vintage, warm and tube-like sound, with a deeper bass response. The TubeBaby's amp emulation technology allows you to use this characteristic, and apply it to any signal. Or, using the proven amplifier combinations, we will try to emulate other well-known sounds.
