Download □ Bollywood Special Girlfriend (2018) S01 Hindi Subtitled Mp3.1. Field of the Invention The invention is directed to a device for loading and unloading an article and, more particularly, to a device for loading and unloading an article to and from a vertical pallet stack. 2. Description of the Prior Art Vertical pallet stacks are particularly advantageous in space-limited applications such as in aircraft where space is limited for the stowage of cargo. U.S. Pat. No. 4,306,562 discloses such an aircraft cargo storage pallet system. Vertical pallet stacks are also advantageous in industrial applications where automated shipping systems must have access to the stacks in order to remove the pallet stacks to a use location. Vertical pallet stacks must be readily accessible and accessible from all sides. Many prior art vertical pallet stacks are therefore typically designed with a large area, with large openings and removal passages, to improve accessibility of the stack. Such large openings, however, are typically difficult for industrial robotic devices to negotiate, particularly in horizontal cross-sections, and difficulties in robotic devices to negotiate large openings, particularly in horizontal cross-sections, increase the cost of the automated shipping system. In order for storage pallets to be readily accessible from all sides, the storage pallets must be vertically separable from one another. Some prior art pallet systems do not have large openings, yet they are separable from one another because they have little or no structure in horizontal cross-sections through the pallet stack. Such structures could interfere with the insertion of robotic devices in horizontal cross-sections. In many prior art pallet systems, pallet and pallet support structure are continuously attached, typically by riveting, along the length of the pallet system. This continuous attachment reduces the efficiency of transporting the pallet system because more material must be removed to create access to an end of the pallet system than would be required to create access to the end of the pallet system in a non-continuous arrangement. Further, many prior

art pallet systems employ pallets and pallet support structure which are folded or warped into the final position and which must be stored in this folded or warped position. Because the folded or warped pallet system is stored in this folded or warped position, there is no simple way to adjust the position of the pallet system relative to a use location without having to reload the pallet system with the various components
