In the newly added dialog boxes, you can add a User Variables (Settings) subsection to each dialogue box (has a yellow pull-down arrow button at the top). User Variables allow your presets and preferences to be saved so that they are stored in RAM when you start working with the software and load them when you're not using Photoshop, or you are switching computers. You can also set each individual preference prior to starting the app so that it's always available if needed. Other upgrades include the addition of two layers that allow you to select only part of an image or crop the image. The new Union of Layers command eliminates any redraws that might otherwise be experienced if you need to combine two or more images or layer groups. This works great, for example, if you make complex digital borders to mask unwanted areas and make enhancements. Union of Layers essentially combines the two into a single composite in the image. Another thing the software can do better is to shed its image-only view, considering layers and masks are much more useful when they involve not only text documents, but also photographs, videos, and even vector-based illustrations. Better controls for layers and masks - both in Photoshop and ACR - would also be welcome. In addition, I would love to see an automatic layer sync feature, to ensure a smooth transition from one edit to another in a complex file. And whatever happened to presets for color and image-editing? Now, I have to think of all those files and my precious time.
